

Which one is better: a linked list or an array?

An array, list. Are there any other kinds of data collections?

Abstract data types  
Generics  
Generic methods

Knights have to be military organized:

- Knights can be arranged into squads
- A squad can be a part of another squad

⇒ A squad can consist of other squads and individual knights

Getting the knights out of any military unit has to be transparent to the client code

Object-oriented means enable to provide for structures for an effective processing of complex data

Data often have to survive the program execution: they have to be persistent

Rytieri môžu byť organizovaní do oddielov a ľubovoľnou hĺbkou hierarchie, pričom je potrebné rovnakým spôsobom z akéhokoľvek oddielu vybrať všetkých rytierov

## Composite

elements may be composite and atomic,  
and the way of accessing them has to be uniform

Enabling an equal access to the hierarchically organized data

Program raz skončí. Ako uchovať údaje, ktoré zostanú po ňom?

Serialization is a realization of persistence

The input/output system in Java: an example in exercises

Lecture 5:

# Structured Data Types, Generics, and Persistence
